INTRODUCTION

1.1 PURPOSE OF STUDY

The purpose of this report is to discuss the water facility needs of Green River Ranch Business Park Development (Project) as it relates to the City of Corona's plans for the domestic water system. More specifically, this report will present the existing water system, the estimated project water demands, and proposed pipelines needed to support the proposed project and adjacent developments. It will also identify the approximate water distribution line alignments and pipe sizes, as well as proposed reservoir and pump station locations and sizes. The project water demands are based on the proposed land use and the City of Corona 2005 Water Master Plan. **Figure 1-1** provides a location map for the project.

1.2 PROJECT DESCRIPTION

The Project site is comprised of 159.1 acres of vacant land situated in the hills to the northwest of the City of Corona in Riverside County, adjacent to Green River Road. The site is located on the south side of the 91 freeway, just west of the 71 freeway, and approximately 5 miles west of Interstate 15 (I-15). **Figure 1-2** provides a vicinity map of the area illustrating the location of the project and the surrounding land uses in the area.

The Project is within the Green River Ranch Specific Plan, bounded to the north by Green River Road and the 91 freeway. The Project is bounded on the south by hillside, and to the west and east by vacant land. The site consists of sparsely vegetated and otherwise undeveloped land with the exception of some dirt roads. The site is characterized by relatively flat topography on the north end of the site with hillside on the south end of the site which introduces offsite flow into the site. Small ravines are present which convey the natural drainage through the project site.

The proposed development plan for the Project consists of five industrial buildings that are 80,320 square feet (SF), 93,868 SF, 124,693 SF, 125,521 SF, and 284,698 SF within the business industrial designation. Only a portion of the site will be graded for development based on the tentative map provided in **Appendix B** for reference. In addition, this study includes the analysis for the future 5.5 acre general commercial parcel north of Green River Road and the 89 acres of Estate Residential situated on the southern portion of the property.

1.3 RELATED STUDIES

The City of Corona Water Master Plan, prepared by AKM Consulting Engineers in September 2005, provides a regional study identifying existing and future proposed water supply, storage,

and transmission facilities within the City's ultimate service area. The study also presents design criteria to be utilized in evaluating water supply, system pressures, pipeline velocities, fire flow criteria, storage volumes, and pump capacities. The report also provides information on the City's planning and evaluation criteria that can be utilized to determine projected water demands.

2
DESIGN CRITERIA

This section presents the design criteria used to evaluate recommended water system improvements required for Green River Ranch. The criteria utilized in this study are in accordance with the City of Corona 2005 Water Master Plan, and the 2012 Department of Water and Power Design Policy.

2.1.1 WATER DUTY FACTORS

The water duty factors used in projecting average day water demands for the project are based on 1,500 gpd/ac for Business Industrial, 1,610 gpd/ac for Commercial, 1,200 gpd/ac for Estate Residential, and 1,000 gpd/ac for Open Space. As discussed with City DWP staff, this project will not have reclaimed water facilities to connect into and therefore will use domestic water to irrigate the proposed landscaped areas within the project site.

2.1.2 PEAKING FACTORS

Per the 2012 DWP Design Policy, the maximum day demand (MDD) Peaking Factor is 1.8 times the average day demand (ADD). Factors for peak hour demand (PHD) vary by pressure zone and are influenced by demographics and the magnitude of demand within each zone. Per the Water Master plan, Zone 5 has a Peak Hour factor 1.67.

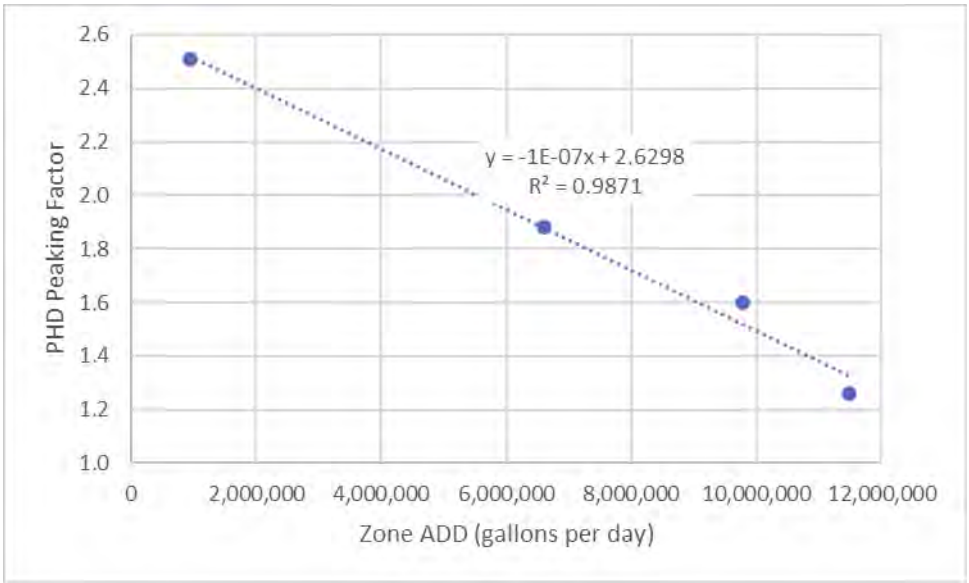
Four existing pressure zones (2, 3, 4 and 6) have demographics similar to the proposed development (i.e. predominantly residential). Per the water master plan, ADD and PHD Peaking Factors for these pressure zones are provided in **Table 2-1.**

Table 2-1 – Peak Hour Demand Summary

Zone	ADD (gpd)	PHD PF
2	11,486,090	1.26
3	9,773,810	1.60
4	6,602,020	1.88
6	944,220	2.51

A plot of ADD vs PHD Peaking Factor results in the curve shown in **Figure 2-2.**

Figure 2-2 – ADD vs PHD Peaking Factor



The curve in Figure 2-2 can be described using the following equation:

$$PHD\ Peaking\ Factor = 2.63 - 1.135x10^{-7}ADD$$

The Water Master Plan establishes PHD peaking factors per zone, but states that they are a factor of ADD. After reviewing the factors provided, it is clear that the peak hour factor should be multiplied by MDD to get the PHD. The reason for this being that the PHD factors provided are often lower than the MDD factor of 1.80. If the PHD were to occur on or near the MDD, it would be expected that the PHD peaking factor would be greater than 1.80 times the ADD. Therefore, the peak hour demand will be calculated using the following equation:

Peak Hour Demand = PHD Peaking factor x MDD
Or
Peak Hour Demand = PHD Peaking Factor x (1.80 ADD)

The Zone 1B PHD is calculated as follows:

Zone 1B PHD** = 2.25 x (1.80 ADD) = **4.05 ADD

2.2 PLANNING CRITERIA

The planning criteria are used to evaluate the proposed water system to ensure that adequate service is provided under all demand scenarios considered. A list of planning criteria used in the evaluation of this project is shown in **Table 2-2.**

TABLE 2-2

PLANNING CRITERIA		
Description	**Value**	**Unit**
Peaking Factor MDD	1.80 x ADD	unitless
Peaking Factor PHD in Zone 1B	4.05 x ADD	unitless
Maximum Pressure	120	psi
Minimum Residual Pressure		
Average Day	50	psi
Maximum Day and Peak Hour	40	psi
MDD + Fire Flow	20	psi
Static Pressure Requiring Pressure Regulators	80	psi
Maximum Pipeline Velocity		
Average Day Analysis	5	fps
Maximum Day and Peak Hour Analysis	7	fps
Fire Flow Analysis	12	fps
Fire Fighting Capabilities		
Single Family Residential – 2 hours duration	1,500	gpm
Commercial / Industrial / Mixed Use – 4 hours duration	3,500	gpm
Operational Reservoir Storage Volume	0.5 MDD	-
Fire Suppression Storage Volume	100% Fire Flow Demand	-
Terminal Storage Volume	10% Reservoir Storage Volume	-

2.3 SYSTEM PRESSURES

The water distribution system has been designed to maintain static pressures between 60 psi and 120 psi when possible. This criteria is used to initially divide a project between water service zones. **Appendix C** presents relevant pages from the City's 2011 Water System Atlas, which illustrates the general pressure zone boundaries within the City's service area. The proposed project area is within pressure zones 1B and 2. **Figure 2-1** presents a Proposed Water System Pressure Zone Map, which identifies the proposed pressure zone boundaries for Green River Ranch.

Head loss in water lines is calculated using the Hazen-Williams equation with a "C" value of 110 for analysis of new pipes less than 24-inch in diameter. Computer modeling is performed to ensure that adequate residual pressures are obtained under all demand conditions. The system has been designed to yield minimum residual pressures of approximately 50 psi and 40 psi during maximum day and peak hour demands, respectively, and a minimum of 20 psi during

maximum day demand plus fire flow conditions. Only locations where customers are served need to meet such pressure requirements.

2.4 PIPELINE VELOCITIES

Distribution pipelines are designed for a maximum velocity of 5 fps for the ADD non-fire scenarios. The maximum velocity can increase to 7 fps for Maximum Day and Peak Hour non-fire scenarios. For fire flow scenarios, the pipe shall not exceed a maximum velocity of 12 fps.

2.5 STORAGE VOLUMES

The total required volume of storage in a water system consists of water for operational storage, fire flow storage and terminal storage. As per the 2005 Water Master Plan, the project's operational storage and terminal storage is required to be equivalent to 50 percent of the maximum day demand and 10 percent of the reservoir storage volume, respectively. Fire flow and duration requirements were assumed to be 1,500 gpm for 2-hour duration, or 0.18 MG, for single family residential developments and 3,500 gpm for 4-hour duration, or 0.84 MG, for commercial/industrial developments**.** Water reservoir storage requirements are evaluated on a zone-by-zone basis.

EXISTING AND PROPOSED WATER SYSTEM FACILITIES

This section discusses the existing and proposed master plan water facilities as identified in the City of Corona 2005 Water Master Plan report.

3.1 EXISTING FACILITIES

The proposed Green River Ranch project is located in the hills adjacent to the Cleveland National Forest and Green River Road in the City of Corona. The project is in the City's northwestern water service area. The existing water facilities in the vicinity of the project are located within the Zone 1B pressure system in Green River Road to the north and Zones 2 through 4 pressure systems within the existing public and gated communities to the east. **Figure 3-1** provides the existing water facilities in the vicinity of the project.

There is an existing 1.5 MG Zone 1B reservoir located east of the project. This reservoir supplies the 16-inch Zone 1B line in Green River Road and Zone 1B lines north and west of the Project. The Zone 2 system in the area is located east of the project. Zone 2 water lines are located within Kraft Ranch and supplied from Zone 3/Zone 2 pressure reducing stations. A Zone 2/Zone 1B pressure reducing station is located at the intersection of Dominguez Ranch Road and Green River Road. This pressure reducing station is normally closed but will open if a large demand condition develops within Zone 1B.

3.2 PROPOSED FACILITIES

Figure 3-2 provides the Proposed Water Facilities Plan, which illustrates the proposed public and private water facility improvements and their relative sizes based on the water system model results. The proposed project will construct water facilities in Zone 1B (725' HWL) and Zone 2 (905' HWL) to supply the necessary system pressures for the development. These water facilities include a proposed network of 12-inch public water mains looped within the project site with one point of connection to the City's existing 16-inch Zone 1B water line in Green River Road and one point of connection to an existing 10-inch Zone 2 water system in Dominguez Ranch Road. A pressure reducing station will be proposed where the Zone 2 line is connected with the Zone 1B line near the project entry road and future residential access. Proposed buildings will construct domestic water service connections from the public water main in the main entry road. Looped 12-inch private fire water lines will also be connected to the public water main for each building complex as shown on the proposed water facilities plan.

The undeveloped area in the southern portion of the site is proposed for future Estate Residential development consisting of 32 residential lots as part of Green River Ranch Specific Plan. Two proposed 12-inch public water mains are proposed to serve this future development area. These

lines will be fed from the existing Zone 2 water line in Dominguez Ranch Road. The first line is proposed as part of Green River Ranch Business Park project and the second line will be constructed when required to serve the future estate residential lots.

WATER DEMANDS AND SIZING OF FACILITIES

This section provides the projected water demand for the project and Green River Ranch Specific Plan area and presents the recommended pipe sizes.

4.1 PROJECTED WATER DEMANDS

The water duty factors used in projecting water demands for the project were presented in **Section 2**. These factors were used to determine the average day demands for the project.

Table 4-1 summarizes the projected average day, maximum day, and peak hour demands for the Project. **Appendix D** provides the land use zoning for the area and **Appendix E** provides a more detailed water demand breakdown.

4.2 WATER SYSTEM MODEL & RESULTS

The analysis performed to determine the recommended onsite water system for Green River Ranch consists of computer modeling that utilizes the Innovyze InfoWater 12.4 program Hydraulic Modeling Software. The solution to the computer model is based upon the design criteria as provided in Section 2. A model was created to analyze the proposed water system conditions and numerous demand conditions were calculated to determine the proposed system pressures and recommended line sizes within each of the proposed service zones. A summary of the demand conditions modeled are as follows:

1) Average Day Demand
2) Maximum Day Demand
3) Peak Hour Demand
4) Maximum Day Demand plus 1,500 gpm fire flow at Node FFJ140
5) Maximum Day Demand plus 3,500 gpm fire flow at Node FFJ160
6) Maximum Day Demand plus 3,500 gpm fire flow at Node FFJ202
7) Maximum Day Demand plus 3,500 gpm fire flow at Node FFJ220

Note: Critical fire flow model nodes are chosen based on highest elevation and farthest distance from supply source.

Fire flow modeling was obtained near the intersection of Dominguez Ranch Road and Green River Road and is included in **Appendix F** for reference. These results were used to establish the settings for the Zone 2/Zone 1B pressure reducing station at this location. In the hydraulic model, this station was set to remain closed during non-fire flow scenarios but will open during a fire flow scenario to supplement the supply to Zone 1B.

The proposed private water lines within the business industrial and commercial parcels were included in the hydraulic model. To simulate losses through the backflow preventers at these sites, a valve was included in the model with a head loss curve that approximates the losses through these devices at various flow rates. A typical double check detector assembly (DCDA) with head loss curve has been included in **Appendix E** for reference.

4.3 GREEN RIVER RANCH SPECIFIC PLAN AMENDMENT

As proposed by the Green River Ranch Specific Plan Amendment, the property was planned for business industrial area, commercial area, and some estate residential development. Business industrial and commercial connections to the water system will be made to the existing Zone 1B pipeline in Green River Road while water demands for the proposed 32 estate residential lots in Green River Ranch will be served by the existing Zone 2 system in Dominguez Ranch Road.

Table 4-2 summarizes the anticipated static pressures within each pressure zone. The results of the computer analysis are provided in **Appendix F** and indicate that the recommended piping has been sized to adequately serve the project. Residual pressures in excess of 20 psi are obtained during all maximum day demand plus fire flow scenarios. The proposed pipeline velocities are below the 5 fps requirement during the average day scenario and below 7 fps during maximum

day and peak hour demand scenarios. In addition, the velocities in the lines do not exceed 12 fps during a maximum day demand plus fire flow condition. The proposed piping in these planning areas will consist of 12-inch distribution line.

PHASING & CONCLUSIONS

This section discusses the anticipated construction phasing of the proposed water infrastructure needed to support Green River Ranch Business Park project and future development areas identified in the Green River Ranch Specific Plan. It also identifies and summarizes the water infrastructure required.

5.1 PROJECT PHASING

The domestic water infrastructure facilities will be constructed in two phases based on the needs of the project site. Two independent sources of water will be provided to each zone as required by the City of Corona DWP.

Proposed Project Infrastructure Improvements by Phase

- Phase 1 –
    - Construction of approximately 1,900 feet of offsite distribution water pipelines on Green River Road and Fresno Road to supply the Zone 1B Green River Ranch site. Construction of approximately 820 feet of Zone 1B public onsite water distribution pipelines in main entry road and necessary pressure reducing station.
    - Public fire hydrants will be added along Green River Road
    - Construction of 6,800 feet onsite network of private looped fire lines around buildings 1 through 5
    - Construction of approximately 1,820 feet of Zone 2 public onsite water distribution pipeline to serve landscape slope to the south and provide secondary point source to Zone 1B.
- Phase 2 (by others)
    - Future construction of approximately 2,500 feet of public onsite distribution water pipelines to Parcel 6 estate residential in Zone 2.
    - Future construction of approximately 1,100 feet of private onsite fire water pipelines for Parcel 7 in Zone 1B.

5.2 CONCLUSIONS

The development of Green River Ranch Business Park will require the following Water Infrastructure to be constructed for the build-out condition:

Proposed Project Infrastructure Improvements

- Construction of a proposed onsite and offsite 12-inch public distribution pipeline approximately 7,040 feet in length, including public fire hydrants along Green River Road.

- Construction of proposed onsite 12-inch private fire water distribution pipelines with a combined length of approximately 7,900 feet in length.

These proposed water infrastructure facilities with respect to their proximate locations, alignments, and sizes are consistent with the City's 2005 Water Master Plan and related water system studies in the City's service area. The proposed project onsite water facilities presented in this report are preliminary estimates of the anticipated water facilities necessary to service the project needs. A detailed water facilities report shall be prepared during final design to confirm actual required sizes of pipelines, valving, pumps, and other related appurtenances.

Double Check Detector Assemblies

Sizes 2½" – 12" (65 – 300mm)

Series 774DCDA Double Check Detector Assemblies are designed for use in accordance with water utility non-health hazard containment requirements. It is mandatory to prevent the reverse flow of fire protection system substances, i.e., glycerin wetting agents, stagnant water and water of non-potable quality from being pumped or siphoned into the potable water supply.

Features

- Torsion spring check valve provides low head loss
- Short lay length is ideally suited for retrofit installations
- Stainless steel body is half the weight of competitive designs reducing installation and shipping cost
- Stainless steel construction provides long term corrosion protection and maximum strength
- Single top access cover with two-bolt grooved style coupling for ease of maintenance
- Thermoplastic and stainless steel check valves for trouble-free operation
- No special tools required for servicing
- Compact construction allows for smaller vaults and enclosures
- Furnished with ⅝" x ¾" (16x19mm) bronze meter (gpm or cfm)
- Detects underground leaks and unauthorized water use
- May be installed horizontal or vertical "flow up" position

Specifications

A Double Check Detector Assembly shall be installed on fire protection systems when connected to a potable water supply. Degree of hazard present is determined by the local authority having jurisdiction. The assembly shall consist of two positive seating check valves located between two resilient seated shutoffs with a hydraulically balanced bypass line and four test cocks. The main valve body shall be manufactured from 300 Series stainless steel to provide corrosion resistance. The check valves shall be of thermoplastic construction with stainless steel hinge pins, cam arm and cam bearing. The check valves shall utilize a single torsion spring design to minimize pressure drop through the assembly. The check valves shall be modular and shall seal to the main valve body by the use of an O-ring. There shall be no brass or bronze parts used within the check valve assembly. The check valve seats shall be of molded thermoplastic construction. The use of seat screws as a retention method is prohibited. All internal parts shall be accessible through a single cover on the valve assembly. The valve cover shall be held in place through the use of a single grooved style two-bolt coupling. The bypass line shall be hydraulically sized to accurately measure low flow. The bypass line shall consist of a meter, a small diameter double check assembly with test cocks and isolation valves. The bypass line double check valve shall have two independently operating modular poppet check valves, and top mounted test cocks. The assembly shall be a Watts Series 774DCDA.
